                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anote—Worder: Bluescript II SK+; Site_1: EcoRI; Site_2: Monte—Worder: Planary was constructed from mRNA isolated from differentiating somatic embryos cultered on MSMGAC. The library was prepared using the Stratagene pBluescript II SK+) library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(df) sequence with an XhoI restriction site. EcoRI apply(df) sequence with an holy restriction site. EcoRI followed by XhoI digestion. The CDNA fragments were digrated to the binnt-ended CDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI XhoI restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. Tissue culture and library construction were performed by Francoise Thibaud-Nissen and Anu Khana (Lila Vodkin lab, Iniversity of Illinois)."

/ncce="Vector: pSDORT1; Site_1: Not I; Site_2: Sal I; This cDNA library was constructed from mRNA isolated from very young cetyledons (20-50mgs fresh weight) of greenhouse grown plants. The library was prepared using the life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly(dT) sequence with a Not I restriction site. Sal I linker adapters were ligated to the blunt-ended cDNA fragments followed by Not I digestion. The cDNA fragments were directionally cloned into the Not I restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E.coli Electromax DHIOB host cells. This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell.

// Anote="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2: XhoI; The cDNA library was constructed from mRNA isolated from mature seed pods of greenhouse grown plants prior to senescence for the cultivar KPl. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI.XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DHIOB host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy

//lab_host="E. stil (B); Immature pollen cones were
sollected in the early spring, frozen and used for mRNA
isolation. The SMART-PCR method (Clontech) was used to
prepare a library from 1 ug total RNA, using the Lambda
TriplEx vector. Plasmid subclones in prriplEx were
recovered by cre-lox excision in E. coli strain BM25.8 and
sequenced from the 5' end."

/note="Vector: plasmid pBK-CMV; Site_1: ECORI; Site_2: DAP)
of spring barley variety 'Barke', a high quality malting
variety. Cloning sites: ECORI (5'-end of cDNA) and XhoI
/3'-end of cDNA). NOTE: Due to a cloning artefact caused
by the kit, in most cases the ECORI site is NOT present,
as well as the ECORI adapter. Average insert size is lkb
Sequence trimming: Vector sequences and sequence ends were
trimmed from the 5'-and 3'-end until a 50 bp window
contains less than two ambiguities. The maximum length was
set to 700 bp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                Sequence 11, 7
